Azure Region Selection and Shared Responsibility Model Report

Name: Timothy Yakubu Osakede

Date: 12 June, 2026

Summary Report

For this lab, I selected East US as the Azure region for deploying my resources. East US is a major Azure region that provides high availability, scalability, and support for a wide range of Azure services. It is commonly used for learning, testing, and production workloads due to its reliable infrastructure.

The resource deployed was an Azure Storage Account, which provides secure cloud storage for files, data, and backups.

The Shared Responsibility Model divides security and management duties between Microsoft and the customer. Microsoft is responsible for securing and maintaining the underlying cloud infrastructure, including datacenters, hardware, networking, and the Azure platform. The customer is responsible for managing access permissions, securing stored data, configuring resource settings, and monitoring usage and costs.

Understanding this model helps ensure that cloud resources are deployed and managed securely while taking advantage of Azure's reliable infrastructure.
